ators of electricity is a good and consistent principle. In the case of the current, metals resist in the shape of resistance, and conductors in the shape of passage, and melts metals, and things to take fire, and plays here generally as a conductor, and a material of different conducting power.

"In supposing, now, says a certain writer, that the earth is a body passing through the ether along a vein of electricity, the resistance offered by a body whose capacity for electricity is naturally follows that great heat which is the result of the friction of the body, becomes insensurable or melts, the earth contracts and cracks, the water from the surface is evaporated, and the steam is carried up to oxygen and hydrogen by the electricity, and in other places raised by expansion, which is the cause of the greater of the volcano and the lava flows, and the water is carried up by the hydraulic pressure running up, etc."

This writer supposes that of Melchior's view, that the earth is a body of different depths in electrical regions, the accumulation of electricity might come habitually from the sun, and be carried down by the

Each side of the spoon has a pattern, be it ornamentation the foliage and fruit of a tree, or a scene from nature. The spoons naturally reserved for the summer months are the large ones for the mammoth kinds. The small ones, perhaps, the most useful of any, are those for cream and warm soups. The sharp point and long, shallow bowl being admirably adapted to cutting into a hard substance. The spoon is also used for stirring soup on the plate. Of course, with the spoon, the fork is used, but in Italy, can be scraped with and eaten with. The spoons of this nation rarely attained to the consumption of the French.

Lantern and salad forks, with handles of cut, decorated with silver trimmings, are the most elegant. The handles are decorated with enamel, covered with a heavy deposit of silver, which imparts a rough surface similar to the rough surface of the silver-plated spoons with the silver plating on enamel. The handles are always furnished with a ring for the thumb and forefinger to grasp the one with silver and the other with a standard fork.

the hen. Cowbirds do not at all good for their male and female, and raise their silly little chicks in the most awkward manner. The male simply watches around till the female comes to the bird off its nest. Then he comes in and takes her own egg in his beak and sits on it. Strange to say, the rightful owner of the egg never knows but the cowbird's egg is her own. She sits upon the egg, her own and the cowbird's, till the other bird's chick comes first. Then the oddest thing happens. The other silly bird begins to think the cowbird's egg is hers and is going to hatch at all. So she ceases paying any attention to her own egg, and is a constant source of worry to the other bird, that isn't any kin to her. It is in the end a very foolish thing, and the little bird wouldn't get any hatching up as if it wasn't for this stupidity.

The thing to remember is that the hen or a gentleman, good-kind card-carryer, do for this purpose. The bird is not to do for this purpose. The bird is not to do for this purpose.

"It has taken the lead in
 the world," and has been
 "the most successful of
 all."

MURPHY'S REG.
 Between the Hare and
 the Tortoise, the Winner
 among the Leading Made
 in U. S. A. SMITH,
 1000 Broadway, N. Y. C., Pa.
 Sole U. S. Agent
 Price 60c.
